## **Abstract**

*The need to have a quickly access to information led to the development of some architectures in the online environment to facilitate the interaction and information access process. Currently, it is not enough just to provide this information, but need more: information have to be correctly and updated. The development of such a mechanism should adopt and meet a set of standards related to content and security modeling. Central government provides information and services that affect the daily life of citizens, but the major responsibility is to give answers and solutions to their problems in a fast, efficient and accurate way. The quality of information and services provided by government requires a holistic approach to implement mechanisms for identity and content standardization, but also for applications and services security in Internet.*

**Index terms:** public administration, Internet domains, standards, identity, security, content, e-government, information technology, government portal
