Analiza atacurilor informatice de tip viruși, troieni și viermi informatici

Cyber-Attacks (Viruses, Trojan Horses and Computer Worms) Analysis

Abstract

As computer devices have become more pervasive, so has Malware. Cell phones, email, instant messaging, internet browsing, everyone is threatened. Viruses, worms and Trojan Horses are all malicious programs that can cause damage to a computer or a computer network, but there are differences among the three. This paper analyses both similarities and differences between the three methods of attack.

Index terms: cyber-attack, virus, worm, trojan horse
