Abstract

For all nations, the revolution in the area of information technology has changed the way business and government operate, as well as the daily life of citizens. Effective cyber security is the key to any nation's ability to protect its assets, including its reputation, intellectual property, economy and citizens. To counter the evolving cyber threat facing today, leaders must ensure they have an integrated approach to cyber security tailored to their particular aspects and risk profile, addressing not only technical aspects of their defence, but also the people.

The National Cyber Security Strategy establishes the strategic priorities that the national government will pursue in order to achieve the overall aim and objectives of the nation's cyber security policy.

Index terms: cyber security strategy, cyberspace, cyber threats, protect, risks
