Abstract

In an education-based society, the strength of the educational system promoted at a certain moment in time is given by the broad dependency on the level of the social, economic or cultural development. The knowledge society, and its assimilated variant – the information society, are not lacking of vulnerabilities and risks related to the security of the technology their existence depends on. From a beneficiary, the education becomes a security provider; through a timely yet necessary implication, in order to ensure a comprehensive and suitable training of all citizens with regard to the protection of the cyberspace, of the rights, interests, and opportunities that may influence our nation's social and economic development.

Index terms: education, Cybersecurity, information society, internet
